

Why external proofing is essential to your business

Pests can put your customers' and colleagues' health at risk and compromise your brand reputation. Without adequate protection, your building could be vulnerable to pest infestations.

Rodents carry germs and diseases and can significantly damage buildings, equipment and stock

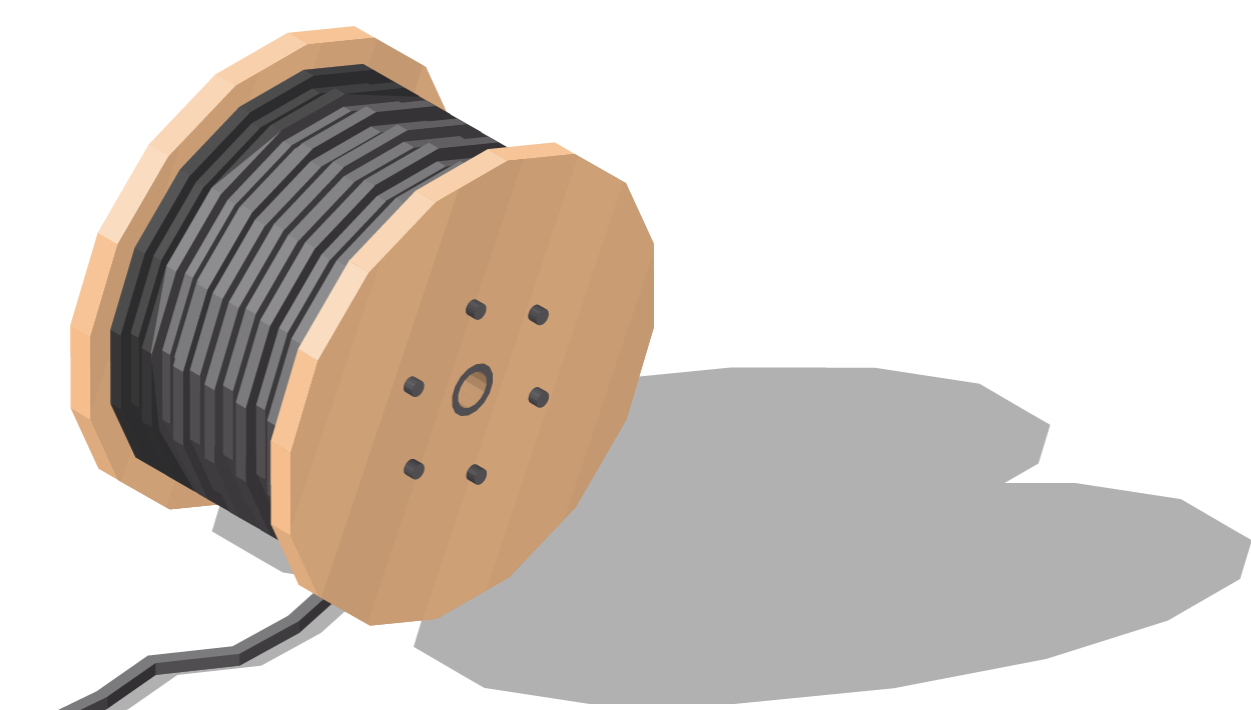

Flying/crawling insects can spread pathogens or disease, contaminate food and surfaces and bite humans

Birds can damage buildings; they carry disease in their faeces, feathers and nests

Cables

Rodents can climb almost anything, so appropriate barriers need to be put in place to prevent entry

One hole can lead to an infestation; inspections and proofing methods – foams, sealants, barriers – are essential to block these access points

Holes

Holes act as entry points for pests – mice can squeeze through 1cm holes and cockroaches can enter through cracks in tiles

Doors

Gaps under closed doors can allow pests to enter

Our solutions provide practical, effective barriers

Insect screens on doors/windows prevent flying insects entering

Open areas

- Loading docks and delivery areas are at increased risk of pests entering undetected
- Flexi Armour Dock provides an impenetrable barrier on dock-leveller gaps
- PestConnect solutions provide 24/7, remote, digital monitoring in and around your site to identify the points of pest activity and entry

Attractants and deterrents

- Expertly designed units placed outside will attract and trap flying insects before they enter your facility
- Bird netting, sound systems, hawking and other deterrents help prevent birds settling on your premises

What can you do?

Contact the experts in pest control to discuss proofing solutions and strategies that include connected solutions and remote monitoring and minimise the potential for pest problems in your business.
